

# Integration with Cisco FireSIGHT Management Center

*Technologies must interoperate in order to deliver fast, accurate and effective information to facilitate impactful decisions.*

*SAINT results provide insight into security risks that impact the confidentiality, integrity, authenticity and availability of critical information and IT infrastructure.*

## SAINT Integration with Cisco FireSIGHT Management Center

Cyber threats to companies of all sizes can come from anywhere— from individual hackers with personal vendettas, to state-sponsored attacks that impact critical infrastructure and national security. Organizations and individuals face an enormous challenge in protecting critical resources and sensitive information. This complex environment requires significant investment in defensive technologies designed to protect, defend and mitigate against these threats. In order to be effective, technologies must interoperate to obtain the highest possible return on investment (ROI) and deliver fast, accurate and effective information to facilitate impactful decisions. At SAINT, a key tenant of our core strategy includes creating strategic alliances with solution providers with a proven track record of leadership and success in delivering security solutions to a world-wide market. In 2014, execution of that strategy included creating a technical partnership with Cisco, as a Cisco Solution Partner.

### SAINT Security Suite

SAINT Security Suite provides authenticated and unauthenticated scanning and assessments of a wide range of network-based hosts. The results provide insight into security risks that impact the confidentiality, integrity, authenticity and availability of critical information and IT infrastructure. SAINT Security Suite identifies risks from host vulnerabilities and configuration weaknesses, exposure of sensitive content, risks to web applications and servers, as well as risks propagated as a result of the actions of the users that expose sensitive content or critical assets. SAINT extends the value of its solutions by providing integration and interoperability with other security investments.

### The Partner Solution

As a Cisco Solution Partner, SAINT is a member of the Cisco Security Technical Alliance program—an ecosystem of complementary technologies to help customers gain better security, faster resolution of critical events, and increase return on investment (ROI). Partners in this program have developed a proven integration capability with the Cisco Security product portfolio's open and proprietary APIs and other integration points. SAINT Security Suite is part of this ecosystem— providing interoperability with CISCO's FireSIGHT Management Center, to support aggregation and correlation of vulnerability scan results as part of your overall risk posture within Cisco FireSIGHT analytics.

*The combined power of this content enables users to align threat and vulnerability data for a more complete picture of risks.*

### How it Works

Cisco FireSIGHT enables customers to configure secure connectivity and data interoperability with other Cisco Partner solutions, thus enabling security information derived from these solutions to be automatically integrated into the correlation engine for analysis.

SAINT Security Suite provides configuration settings to define the Cisco FireSIGHT deployment to receive scan data, as well as global or job-specific configuration options for determining the source data to be transmitted.

The end result is integration of SAINT scan results into the analytics capability within Cisco FireSIGHT, as shown in this example.

The combined power of this content enables users to align threat and vulnerability data for a more complete picture of risks.

### About SAINT Corporation

Since its inception in 1998, SAINT has been developing innovative software solutions. SAINT's customers include high-level government agencies, top colleges and universities, and major financial institutions. Industries and governments all over the world are using SAINT products and services to manage IT security risk and compliance. SAINT Security Suite enables customers to:

- Identify security vulnerabilities on network devices, operating systems, desktop applications, web applications, etc.
- Detect and fix possible network security weaknesses before they're exploited by intruders.
- Anticipate and prevent common system vulnerabilities
- Demonstrate compliance with current government and industry regulations, such as PCI DSS, NERC, and FISMA.
